i've always had my settings for internet and intranet set at  
enable  
disable  
disable  
enable enable

for a long time and never had any ill effects. the whole thing started when i got that darn dragon themes for my wife. i have just downloaded a copy of firefox and installed it as a alternative for IE6 . its ok, but i like the way i can have my fav's open to the left and just click which one i want. firefox is a bit diff. you have to keep going to the browser each time and click/ i wished it would stay open like IE6. i know, it has tabbed browsing. but i have so many places in my list it wont list then all unless i choose open tab. then i have all these little deals stuck across the bottom of the upper browser header and i cant tell which is which. anyway i just ran a checkdisk set to auto correct errors. and apparently it fixed some things. too quick to see what it did screen only stays up for aboput 2 or 3 secs. but im using the IE6 now and i havent seen any popup messages for activex or script allowing yet. i have been to several sites and forum places and nothing yet. maybe that fixed it. maybe there was a error someplace that was causing it due to me removing those darn themes. who knows, but it seems ok now. might be just temp. though. i'll just have to wait and see. but i linked to those places you gave me. the winsock and other stuff and these in case it happens again maybe theyll help if need be for it again. i appreciate the help youve given me. those links and all. thanks, scott lang

Create a folder on the hard drive of the other computer called HOLD, download the programs to that folder, then burn that folder to a CD. Copy the HOLD folder to your HD and then install the programs from there and run them. After you have IE access again, update all programs where possible to get the latest definitions and run them again in Safe Mode to be sure there are no lingering items on the system.
