I intalled the Firefox browser to see how it worked, did not find it as good as IE6 installed with Service Pack 2, I run windows XP Pro, I then uninstalled Firefox and found IE6 is not fully intigrated into the system, for example if I click on a web link in my contacts or one that is emailed to me I get a message stating an unexpected error occured. I tried to reinstall IE6 and get a message a newer version is already installed and that the installation has been terminated. Any suggestions?
