hi,

i have a vb.net web application and i make a request using internet explorer to an aspx page. the aspx page size is over 170KB, and the page in internet explorer looks truncated and in the view-source the text/html is truncated in the middle of a line. the last line looks like that:

```
<td with
```

and that's it.

i checked the HTTP headers and saw that the aspx page have a Transfer-Encoding: chunked header, while asp page that have the same logic and is not truncated (it's smaller – about 80KB) does not have this header.

can anyone help with this issue:

- a. how can i, in order to check if this is the source of the problem, disable the chunked transfer encoding of the aspx page.
- b. what might be the problem?

i guess it is not client (iexplore) related problem, but it might be a problem with the receiver of the data and not with the sender (IIS) of the data.

TIA, z.
