Hi,

Without knowing the specifics of the database and the data being pulled, I wouldn't feel too comfortable helping on that account. However, depending on the language you are using, you may be able to split up strings. If this is the case, you should be able to make each section into its own string, and place one on the left side, and another on the right.

With respect to the actual coding in making the table, the following page may be of use:

<http://www.htmlite.com/lite012.php>

<http://www.htmlclinic.com/tables.php>

Both pages explain how to code and design tables. In your case, you could combine it such that it displays the table with whatever content you want inside of it.

Hope this is of use,

Regards,

Altrus

: Hi,

:

: Thank you for responding my question and for your explanations.

:

: I agree. I think would be the best if I can design the page to either:

: 1. Having two side by side sections, each section pulling data from  
: a different table,

: OR

: 2. Showing 2 columns in body.

:

Re: autorefresh?

: Could you help me to do that?  
: I greatly appreciate your help.
