Isn't there anyone that will help and reply to our specific concerns. Had another crash today, this time, all of a sudden (after surfing for about an hour trouble free) could not get into a site. Hit stop, tried again, no go. Tried other sites no go, nothing, nada. Closed out of IE got an error, checked in event viewer, this time no error reported in there. Error said to click OK if I wanted to close program, did not copy down numbers on this one, funny it did not appear in event viewer. Once I had closed out of IE, went back on and was fine. Did not have to delete anything, worked as before. As I mentioned in my first post, clear all cookies, temp files, History, SSL certificates, and all autocompletes all the time. Sometimes more than twice a day. Run Adware Se with updated definitions and Webroot free scanner all the time and never find even a cookie, all deleted before scan. Have Lynksis router with good firewall, Mcafee security center with viruscan, firewall plus, and privacy service which contains popup blocker, add blocker, and web bug blocker. All popup blockers enabled in IE. Do not download anything from internet except updates and do not ever click on adds. Unlikely it is spyware problem. Would really like some help. Is something corrupt in my IE? Should I lower TIF from 252? If I delete all temp files like I do does this make a difference? Is my Content IE5 folder corrupt? What gives? Any help would be appreciated.
