Don, thanks for the response. Are you talking about addins or things like Adobe and Java which both work with IE on certain sites. I do know that I had used both Adobe and Java during my surfing before this error. Would not know were to start because the error is not reproducible in any one situation. It just happens, and only twice in the last month. Only other thing was an IE hang that I had only once. With that in mind, could you advise on how to focus in on what might be causing this issue? Thanks.

KM1
