In recent times, there have been some printing problems related to the borders and white space, when printing out WEB pages.

I normally set the borders to 0.5" all around. In times past, this was fine, and the complete page would print, with my designated header and footer within the printable area of the page. Lately, a small part of the right side of the page would be cut off, and this "cut off" displayed in the Print Preview window, so it was not due to a printer "problem". So today, I reduced the L and R margins to 0.3". This seemed to resolve that problem. But suddenly, the header and footers have now moved out of the printable area, to the extreme top and bottom of the page. As a result, they don't appear on the printed output, except for a "teeny" bit of the text that crosses over into the printable area.

Changing the top and bottom margins does not have an effect upon where the header and footer are located. In a "normal" situation, such as in WordPerfect, or Word, when the top/bottom margin is changed, the locations of the header and footer change accordingly, but apparently not in printing out web pages from XP SP2.

I've searched all over, but cannot find any path to correct this situation. does such a path exist? The usual "setup" window to control the settings of the printout does not offer much in the way of options.

I would also like to be able to keep my L and R margins at 0.5", but as I noted above, that clips off a small amount of the right side of the page printout. There must be some settings somewhere that will allow me to fix my current problems.

Can someone point me to them please –

Ron Hirsch
