I have a client using Windows in a peer-to-peer network. There are all versions, but mostly Windows 2000 and XP Pro.

They are having problems with people messing up their PCs (probably on night-shift) by downloading junk and introducing spyware to the systems.

I have been asked to lock down certain PCs, allowing them to only visit approved sites. Can this be done with Group Policy? I'm wondering how to use it to restrict the use of Internet Explorer to Trusted and Local sites only, and then I could disable the security applet in Internet Options, thereby restricting them to my Trusted Sites.

However, I am dismayed by the lack of decent documentation on the use of policy for this. Am I dreaming, or isn't this what the GPEDIT.MSC is for?

I would appreciate any input anyone can provide.

Thanks
