couple questions:

1) your using a linksys wireless router of some sort? do you know how to enter your webpage manager for it <http://192.168.1.1> and login? the default user name is admin and password is blank or the username is blank and the password is password or admin or administrator something like that. When you enter this webpage, you will see an "ipconfig" for it where it will show your external ip address , gateway and dns servers , paste those here as well.

2) when you browser to <http://www.yahoo.com> and go to mail it works fine?

3) are there any odd entries in c:\windows\system32\drivers\etc\hosts file when you open it in notepad?

4) im assuming in control panel > network connections > lan connection > properties > tcp ip > properties that you have "obtain ip address automatically on"?
