I've been having a problem for the last couple of months on my laptop. In IE6 I get the following screen to appear when I try to get to an HTTPS site:

(Note: I have tried uninstalling and reinstalling IE6 (and marking the registry as removed), but cannot resolve this problem. Any help would be appreciated as my company has an application that is written ONLY for IE w/ 128 encryption)

-i.j.

No Shared Cipher

Your browser is unable to negotiate a security level which satisfies the requirements of this site. For security reasons, this Web site may require strong encryption. To gain access to this site, you may try any or all of the following:

- 1) Change your browser's security settings to support the appropriate level of encryption (the cipher suites supported by this site are listed above).
- 2) Update your browser to a version that supports the appropriate level of encryption.
- 3) Apply the "strong-encryption" option pack to your operating system.
- 4) If in the United States, verify that you are using a recent domestic version of your browser.
- 5) Contact this site's administrator for assistance.

Security Details:

Browser ciphers:
DES-CBC3-SHA

Secure Site ciphers:
RC4-MD5
RC4-MD5

IE6 – No Shared Cipher Message
