I have read quite a few posts here and on other sites about folks having problems running Java in IE.

I currently have that problem on a few machines, and are looking for a resolve. This seems to be occurring on IE 6, on both XP SP1, XP SP2 and 2000 machines. So far specifically IE 6.0.2800.1106 SP1.

We have MSVM 3810 (yes I understand it is no longer being supported so please don't tell me that) installed as well as Sun Java 1.5.0_04. We have uninstalled, and reinstalled, and java is enabled in the browser and in the control panel. When we try to load various applets, we get messages like "Java is not enabled" or "Java is not working" – but it is installed and enabled and applications can run – just not items in the IE browser. Sun works in other browsers on the machine, just chooses to not work in IE.

I'm starting to dig into anything I can find and are trying anything I can find to fix the problem. I've checked security settings in IE. I'm trying to delete items from in the Downloaded Programs Folders (incase they are corrupted). I am removing applets from in the java control panel, I've tried re-registering URLMON.DLL and resetting web settings in IE..My next step is to start checking registry to see if there is something in there – maybe bad user agent string, or something like that...? I've also disabled 3rd party BHO's in the advanced tab in IE Options. I've tried cleaning temporary internet files and deleting the java cache in the control panel. We've tried running anti-spyware programs and nothing is coming up.

I've started to check recent hotfixes to see if that could be culprit since the problems started occurring within the past few months.

I'm slowly running out of ideas other than format and reload – and I am much too interested in finding what the problem is than to give up and reload especially since this behavior is on multiple machines and not just one. I know it isn't just my machines since there seems to be a lot of similar posts on the web.

I've tried coming up with a common denominator for all the machines, but they are different OS's – all running IE 6 and some have McAfee of some sort running on them, and yes – I have checked firewalls to make sure java

Java not working in IE

isnt blocked on the local machine. I have a friend who works at a local college and is also seeing this problem on a few of her machines.

Any other suggestions greatly appreciated ! I'm sure others have seen this problem or are having this problem – any input welcomed.

Shayla
