We are in an enterprise domain and connect to an Exchange Server via either Outlook 2003 sp2 or Outlook 2000 sp3. On different machine i have the xpsp2 version of IE installed), both "Send page by e-mail" and "Send link by e-mail" not function. They idle for a while then report that the Exchange Server is offline. We have Firefox and correctly initialize and present an Outlook mail form. I cannot find anywhere on the Microsoft site information about this problem. If we choose Outlook Express (as default program) all function. Have any idea about ???? thanks...
