Hi Mike ;-)

"> Jan,

That cured the problem, but now I've lost my Google toolbar, and my RoboForm toolbar, both of which I had before when everything was working okay, and both of which have been very useful to me. Can I put them back now?

--
Mike McDonald

Did you run all the programs I provided for you? If you posted your Hijackthis log, would you please post the link to it here? It would be helpful to see what the results were from the analysis.

If you have not run them yet, and enabling the 3rd party extensions has seemed to resolve the problem, then your system is definitely infected and you do need to follow through with the cleaning process.

Hope this helps.

I would not reinstall the other toolbars and RoboForm just yet.

Re: Going back to original web page

Hi Mike :-)

Third-party programs, such as adware, spyware, parasites, Trojans and worms.

Try this: Go to Tools > Internet Options > Advanced > Browsing
Uncheck the Enable 3rd party browser extensions

If this clears your problem then find out who the culprit(s) is/are. Be aware, your Anti-Virus won't detect all types of warez, Trojans, malware, worms, etc and neither can other aware or spyware related programs such as

AdAware and SpyBot. They don't have the proper definitions. So even if you

run it and nothing shows up, it does not mean your system is clean. It takes a series of programs to fully clean your machine. Some very aggressive

and damaging variants of malware can replicate themselves repeatedly, or mutate, if not removed properly. Follow the steps below::

Dealing with Unwanted Spyware and Parasites:

<http://mvps.org/winhelp2002/unwanted.htm>

Downloaded –Aware SE and SpyBot S&D from here

<http://www.majorgeeks.com/downloads31.html>

Install, immediately update and run them in Safe Mode with Hidden Files enabled

also.....

Download and install HiJackThis. This is one of the most important steps. Follow all instructions carefully. This program should be run in Normal mode.

How to download and install HiJackThis: Win 98-XP

http://www.download.com/HijackThis/3000-8022_4-10227353.html

Please.. DO NOT post your log HiJackThis log to this newsgroup. DO NOT delete anything from the list yourself unless you are an experienced user of

this program. It is important that you go to one of the HiJackThis Support

Forums below and allow the experts there to analyze it for you:

AumHa HiJackThis Forum

<http://forum.aumha.org/viewforum.php?f=30>

to allow the experts there to evaluate your log and advise you of any necessary steps to clean your system.

(Note: You will have to Register before posting on these Forums. Please follow all posting instructions carefully to avoid having your log

Re: Going back to original web page

deleted
or ignored.)

The forums are very busy, please be patient.

Hope this helps.

Jan, I am using XP, and IE6. The suggestions you had didn't work. It happens on ALL web pages. Yes, when I click on Open in A New Window, it does. But, even after applying your suggestions, whenever I click on Close (after opening in a new window) IE shuts down instead of going back to the original page which is what it's supposed to do, and has done in the past. I just can't figure out what's going on. Do you have any other suggestions?

Hi Mike :-)

You don't mention the version of Windows you are using, but, try the following and see if it helps:

Re: Going back to original web page

First, go to Tools>Internet
Options>Advanced tab>
Reset to the "Default" settings
Do the same thing with the Security settings.

Close IE and reopen. See if that resolves the
problem. If so, then
you
can
slowly reapply the personal settings that you
changed before one by
one,
to
see which one, if any, may have caused the
problem.

also..

Internet Browsing

<http://www.santarosa.k12.fl.us/parents/TechTips.htm>

Grayed out Buttons and Menu Items that Don't Work:

It is a convention in many Windows
programs and in the popular
browsers
to
"gray out" items that currently aren't
applicable. So, if you think
your
BACK button isn't working, it may be
because in that particular
instance
it
isn't applicable. For example, if you just
opened your browser and
this
was
the first page you viewed, then there isn't a
page to go back to, so
the
BACK button is grayed out.

Is it only a few sites, or all of them? Is the
site or page opening
in a
new window? Opening in a new widow can
disable the Back button. In
all
dominant browsers, webmasters using the <a

Re: Going back to original web page

target="_blank"> tag to force a link to open in a new window breaks the Back button. The new window does not retain the browser history of the previous window, so the "Back" button is disabled. It does sound as if this might be what is happening on these sites.

also.....

Help Getting Back

<http://www.soundfeelings.com/free/back.htm>

As an additional note.....you should also be aware that webmasters can, and many do, set up their website coding to prevent use of the back button, which will create the Page has Expired situation, and there is nothing you can do to correct or prevent this in IE. Once you are sure you have covered all avenues on your end to be sure it is not IE related, you can send a message to the webmaster and ask them to check or remove that part of their coding. It is a widely used practice by many webmasters, but, unfortunately, there seems to be no web policy to prevent this type of entrapment, so to speak, other than peer pressure that it is not good form. Sometimes, it is just that they have not kept up with the changes in XP or SP2 that may affect how those users can access or view their website.

Re: Going back to original web page

It's
just another aspect of the problem many are
not aware of.

Hope this helps.

How to make a good newsgroup post:
<http://www.dts-l.org/goodpost.htm>

Whenever I want to view a
new web page by right
clicking and going
to
Open
In
A New Window, it works
fine, but when I want to go
back to the
original
page
the Back button is, of
course, grayed out so I can't
use it, so I
click
on
the X close button to return
to the original page, but it
closes IE
altogether. This is a recent
development, and I don't
know what
caused
it.
It used to work fine. What
happened? Any
suggestions?
