Hi Enigmatic Source,

You have dns errors for your site

<http://www.dnsreport.com/tools/dnsreport.ch?domain=www.aboring.com>

but I am not sure this is the root of the problem. My own experience is that IE6 SP2 (for XP windows) is intollerant of orphaned tags but by your source this does not seem the case. I see that you have a nested mmm... maybe. I can only suggest that you debug by removing selective elements from your page and then try rendering in IE (both 6 versions).

One point of conjecture is why you choose FF and OP as your test browser platforms. Together they only have around 14% of the browser market (www.thecounter.com). It may be that the corporate policy of your intranet is for these platforms and if this is your only audience then code for those platforms. Just avoid document.all notation in your scripts and remove server side styling then all browsers will be able to render your pages. KISS works!

I'm beginning a corporate intranet site, and I use Firefox / Opera as my default development platforms, but when I tested the demo pages in Internet Explorer, nothing at all renders.

Site URL: <http://www.aboring.com:81/payroll/?module=piecework>

Validates XHTML 1.0 / Transitional

Doc-type text/html

Works perfectly in Firefox, renders but scripts broken in Opera

(Oh, and please don't tease about the cruftyness, I've only spent about 25 minutes on it so far)
