Hi Everybody,

I'm hoping someone can help me with a problme I'm having. I've got a computer that I'm working on that will not access ANY secure (https) websites. The computer is running WinXP with IE6. I've done virus and spyware scans. There are no signs that something is wrong with the computer other that the fact that IE will not access any secure sites. If I try to access a secure site it just times out. My firewall is setup to allow (https) access. Has anyone exerpeinced this? Anyone have any ideas?

Thanks

Sean
