By "pick/mark" do you mean highlight? If so, place your cursor just past the end of the URL and the use the appropriate arrow key to move to the end of the word you want to highlight. Hold the shift key down and use the arrow key to move to the other end.

Hi

I often have to mark out only one word in an urlstring. This can occasionally be very tricky even with a steady hand without opening the link.

Let say I have this link

<http://www.speedguide.net/reviews.php?category=32>

I want to pick/mark the word "reviews" in the above url. But every time I but the cursor on the link it turns into a hand! I have tried holding down the Ctrl key Alt key etc to get the Text tool. But that's the wrong ones.

I have been using to right click – copy link address for year. I was just wondering if there is anything new on the rather small problem
