Hi all, weird problem:

One single web site is blocked and I cant get to it!! I cant even ping the IP of the site. I had zone alarm installed but uninstalled it and no difference. Sometimes when I clear the cache it seems to work but this doesnt happen often engough to be certain.

The only thing that will fix it is a reboot. As soon as I do that, I get the site right away.

I even added the site to my trusted sites list, even though there is no reason I can find why it would need that.

Now here's the irony (or maybe a clue): its MY web site! And its on a server that I run! There's also webmail running on that server and when it gets blocked I cant get to that either. In other words, all of the IPs in that computer are blocked. Yet as soon as I reboot, everything is fine. Im on cable and have a fairly static IP so its not like that changes when I reboot.

Another clue: I cant connect to ANY service on that machine, like ftp web, smtp, nothing until after reboot.

Anyone have any ideas at all here?

Win xp, sp2, all updates. ie 6. cable modem, no router, xp firewall on (now that ZA has been removed), SAV running.

Thanks

Scott
