I run the following programs regularly: Norton, Ad-Aware, Spyware Doctor, and Trend Micro.

They catch, but cannot delete, the following problems:

citlx.da  
dmonwv.dll  
newdotnet7.22.dll  
uninstall7\_22.exe  
nass638.exe

Anyone had particular experiencing removing these and can suggest another method (short of adding yet ANOTHER removal program).

My infestation isn't that severe, so far, just pop ups (that I know of).

The main problem is if someone suggests using another removal program, and i click on a link or navigate to that page, i get another dozen pop ups ABOUT spyware removal, and some new freeloading downloads because of that navigation.

I guess I am looking for a way to directly delete these specific threats. I have done a great many of the hints in the forum, like emptying cache and trash bins prior to running a program, shutting off all other virus checkers, running in safe mode, etc., etc.

Many of the pop ups say they are from "Web Nexus Network", and offer a link to an uninstall tool, but I ain't going there.

Thank you.
