I am running W2K sp4 and IE6 sp1 ver. 6.0.2800.1106 with all hotfixes installed.

I get the following error on MSN.com. The error has been occurring for some time.

Line: 2

Char: 38

Error: expected ']'

Code: 0

URL: <http://www.msn.com>

The line shown for the error changes from day to day and some days there is more than one error.

I have notifications turned off, but the tiny note at the base of the page still comes up: "web page loaded with errors on page" and when expanded give the missing ']' notice.

Other web pages are also showing minor errors; for example the nrvia driver page; I am assuming its java script that's causing the problem but I am not expert enough to be sure.

How does one determine what function is causing the problem and how does one fix it?

.
