I am running windows 98SE and trying to use PC to PC calling in Yahoo messenger 8. As soon as I try to accept a call from someone running XP with a firewall Yahoo messenger crashes. I crash but not the other person.

I went to yahoo messenger help and I quotethem:

What ports are used by Yahoo! Voice services?

Yahoo! Messenger will work if any one of these TCP ports are open:

5061

443

80

At least ONE of these ports must be open in order to make PC-to-PC or PC-to-phone (Phone Out) calls, or to receive calls (Phone In).

Where on do I find if theses ports are open and how could I open one if I need to?

.
