....

Java is also up to date.

Did you see the requirements listed at the bottom of this page?

<http://198.173.15.21/cao/FindMyParcel.asp>

The site uses Javascript, no sign of Java being used.

You could try re-registering its module. E.g. Run...

regsvr32 jscript.dll

Also you could try using a technique I call maximal prompting to see how far you are getting at that site. E.g. use the Security settings dialog to set anything which is currently Enable to Prompt (when available). BTW this could also be used to prove that Java is not being used because then there would be a prompt regarding ActiveX...

FWIW when I try maximal prompting on your page even with Work Offline set I get an immediate prompt for scripting. I reply Yes to that and get my background color but no more content and another prompt for scripting. (Times 3.) Then a new background color. Still blank. Then finally the page is rendered with no further interruptions. So I guess rather than setting all Enable settings to Prompt it would have been sufficient to change just the one for Active Scripting. ;)

The page does have a rather unusual construction. E.g. there is a script element *before* the DOCTYPE and the rest of the HTML. Do you have any programs active which would be trying to inhibit scripting? E.g. perhaps the unusual construction of the page could confuse such software and cause the whole page to be suppressed or otherwise corrupted. Etc.
