Thats no problem Neo I am happy to help where and if I can..we are all a bit like that here including yourself..

I think you have highlighted the issues correctly here and for test purposes its always best to just get it working if ya know what I mean then elaborate from there...

I had at one time used an Iframe in here to display about 4 different applets within one post through an Iframe (sounds like a boast didnt mean it that way)

What I mean by weight is simply the kb size of the images... some class files have an added jar file which is supposed to make stuff load faster..(I have yet to be convinced of that) and in some cases gives a security error in some browsers...and another issue of course is that in ordinary circumstances most people just wont wait that lentgh of time for an applet to show..but I am sure you know that..

I am familiar with the class file you use..if its the one from java boutique...and its normally a reliable class file.. keep up the good work NEO..

Hi Paul,

I understand about the download time. I just used the wrong applet for the tests. There are 13 images of aircraft in there. Definitely too many. The applet is designed to be used on a website only, I guess. The class file is "imagefader.class" An image fades out and another fades in. It is designed to accomodate multiple images. The images are sized OK. I don't know what you mean by weighted. As you look through the threads on the tests, you can see that everyone is having an extensive download time but if they wait long enough, they see it working. Don said that he waited 10 minutes but then it worked fine. I think that the 13 images just take too much time to download. Had I used less images, it would have been better for the tests purposes. Or, in the alternative, I should have used a more

microsoft.public.windows.inetexplorer.ie6\_outlookexpress.stationery: Re: Vicki, Is There A Difference ?

appropriate applet.

I really appreciate your interest in and helping me. I know of no other  
NG like this one with respect to getting help on any problem. Paul, THANK  
YOU, for all the help!

~Neo~

Hi Neo,

with respect mate I gave up after 2 mins...

do you have many images in there? what class files are you using..is it a  
lake applet or something else?? in my experience lots of images being  
called

up to one applet class file dont work well unless you have the appropriate  
class file which is designed to accomodate multiple images...and the  
images

are appropriately sized and weighted..

I may be on the wrong track here Neo as I dont know what your applet is  
meant to show..

(Stop/Start music)

Vicki,

Do you think the removal of the flashing frames  
made a difference in download time? Again, thanks  
for your help!
