Hey folks,

I'm testing out some spam software called SpamCatcher by Aladdin Systems. Besides modifying the email subject with a tag of "[spamcatcher]" that's easy enough to filter on, the software also will tag an email with a header called "X-SpamCatcher-Flag: Yes".

The Aladdin tech people tell me that I need to set an OE6 mail rule to filter on this header in order to send these specific messages to a specific folder. Thing is, I don't know how to do that. I've tried setting a mail rule to look for "X-SpamCatcher-Flag: Yes" in the message body, but it doesn't seem to be working, even though when I check the message's properties/details, I can see the flag in there. I'm positive I have the "X-SpamCatcher-Flag: Yes" text entered correctly in the filter, so it's not an issue of it being spelled incorrectly or whatever.

So, other than To:, Cc:, and Subject:, can OE filter on any other header components? Am I missing something really simple here?

Thanks!!
