align="left"

closing tags are not required for td tr, they are superseded by opening a new td or tr only /table is required

yes its ugly

but that table is presented not as an example of beautiful programming to w3 standards, but as an example of quick n dirty reformatting of text from one source to another

Oreo you and friend can change the default text of notepad2 to match the compose text for your OE

Is the : supposed to be in align="left" ?

Did you mean to leave off the closing TR and TD tags?

I use tables a lot, to align text, not the dumbass table generated by
front

page that are composed of emspaces and nobreak spaces
(am going to leave off the leading <s of each line so this does not show
as
html, parts of my last post got rendered, oops)

```
html>
body bgcolor="#eefeee">
table width="100%">
Caption="This weeks totals">
!--repeat four lines below for each person-->
TR>
TD width="135" align="right">Name
TD width="135" align="right">Count
TD width="*" align="left">Comments (rest of page)
!--repeat four lines above for each person-->
/table>
/body>
```

I like a free notepad replacement called notepad2, unlimited file size
like
wordpad & changes the color of command syntax words so its easy to see

if

you left out any closing brackets or quotes. and cut the text out of
incoming mails, paste them into notepad2 and reformat them, because I

use

the same table a lot, really a lot, I have a template & cut n paste

Hi AlmostBob,

Thank you for your elaborate explanation.

Would it be advisable then to compose my tests first is, say,
Wordpad

adn

copy that into the mail that I want ot forward? Will that way
guard

against

unwanted nbsp–spaces? I would be grateful if you could
suggest another

way,

if this is not the easiest way to get rid of these nbsp–spaces
in my

texts!

Thank you in advance!
Oriolus

The HTML generator in OE attempts to
accommodate human typing.
html treats leading spaces and trailing spaces
as non existent
and multiple spaces as a single space. tabs
and multiple spaces must

be

Re: Two different kind of spaces

created from html entities
{space}d would display as d. when text is entered.
the received message would not match the senders displayed preview if

sent

as typed, the generator inserts a no-break space or em-space appropriate to the text typed .
unfortunately if you type {space}{space}{space} at least 2 of them

must

be

coded as no-break space or the rendered html at the receiver would be

only

one space.
and then later go back and edit out one or more spaces, or edit the text

so

that leading spaces are removed, the no-break space may remain.
creating

a

received image that does not match the senders version.
The same problem the generator was supposed to remedy
is useful to keep telephone numbers on one line
(999) 999 9999 will always display on a single line

I have a question about
spaces typed in
HTML-mode in OE

(6.00.2600.00

/ XP

Home 2002 SP2). At
numerous places my text
appears to contain

normal

spaces

but also 'locked spaces'
(transcribed in HTML as

'ampersand-` `'),

which

Re: Two different kind of spaces

influence the preferred
layout in a negative manner.
I don't know
how

and

when these
'ampersand–nbsp;'s appear
in my text, but I don't want

them. I

want normal spaces that
allow text to be broken to
the next line.
How

can

I

avoide these locked spaces
arrive in my text?
TIA
Oriolus
