It has been suggested that one way around this problem is to use an email relay server. I don't know how these work. Presumably you send email to them and they send it on. My question is, do recipients see the source as being the ISP domain (bill@xxxxxx), my email host server (bill@xxxxxxxxxx) or the email relay server (bill@xxxxxxxxxxxxxxxxxxxxxx)?

Thanks.

I have a Client whose ISP (BT Connect) blocks sending email from anything other than its own domain. He would like to be able to send email using a domain hosted elsewhere.

I'm sure others have come across this problem but has anyone found a way around it?

If this is not the appropriate NG for such an enquiry I apologise and would be grateful if someone can suggest a more appropriate NG.

Thanks.
