

Re: OE newsgroup .dbx file name BUG

szDbxFileName, if NOT, uses "szGroupName.dbx" (if "szGroupName.dbx" already exists in the file directory, uses "szGroupName (1).dbx").

2. When NewsServerA.szGroupName is unsubscribed, the szDbxFileName record is not removed!!!

3. When NewsServerB.szGroupName is subscribed, acts as step 1, uses "szGroupName.dbx".

4. When NewsServerA.szGroupName is subscribed again, acts as step 1, uses the previous recorded szDbxFileName="szGroupName.dbx"!!!

The szDbxFileName record can't be removed with unsubscribing szGroupName, it can be removed only with deleting the news account (and all news groups under this account).

I won't to delete all news groups under either account, so I hack this by:

1. Compact all folder (is this the only way to compact Folders.dbx?).
2. Find "szGroupName.dbx" string in Folders.dbx (compacting delete all unused "szGroupName.dbx" strings, so the found string is the active record).
3. Change the first "szGroupName.dbx" string to "szGroupNam1.dbx", and the second string to "szGroupNam2.dbx", it works!

Could someone tell me if this bug has reported and fixed? And has someone tested this bug on Windows Mail (I have no vista machine)? Why not to give a function of customizing the .dbx file names (both newsgroup and mail)?
