Hi,

I live in the UK

I have bought a Hauppauge 150 PVR MCE that pcworld have just got in recently.

This card says Compatible with "Windows Media Center" on the front of it

everything says it is working, got the remote working and the guide for NTL and I am just not getting a signal in MCE or the winTV application on the composite channel.

from my STB NTL box I have take a wire from the scart-composite to the composite input on the 150 PVR and taken the output from my tv-out on my gfx card back to the tv.

I have checked in my device settings and the only device i can see to do with the tctuner card is under Sound, video and game controllers "Hauppauge WinTV PVR PCI II (26xxx)"

This to me seems correct.

The composite cable works as I have tested it thinking it may be a problem.

I have no inputs on the co-axial tuner as I am under the impression you don't need to if you have an STB connection is this correct?

Any help appreciated as this is driving me nuts

Thanks

Adrian.
