Jeff,

No, I don't have ATI's Multimedia Center loaded, just the hacked MCE 4.10 Catalyst driver and USB RF remote. The primary video display is in fact, a 57" Sony HDTV RPTV. With the 4.10 driver, it gives you a custom setting where you can define exact resolution for your RPTV. In my case, I had to change it to 1776x968 to give it a perfect screen with 0 overscan. This is amazing as the set up was super easy, no need to mess around with registry or Powerstrip to get custom resolutions. You'll love the 4.10 driver, at least I did.

I've downloaded some MS 1080i sample WMV files from Microsoft and I sorted them in "My Videos" folder, they're working great and true HD on the RPTV. Now I need to get some true HD contents instead of just sample clips.
