Configure a computer with a static IP like 192.168.0.22. Connect the computer via a wired connection directly to the DGL-3420. Open a web browser and goto 192.168.0.30 (from memory, but it's in the docs that come with the adapter). You can change the IP to one in the same subnet as your network (depends on what router you are using...) There's even a sniffer that detects wireless networks - pick your and then setup the WPA security.
