Thanks for the thought Fiev, but I don't think it's likely because as I said in my original post, Elonex have already replaced both cards and the problem still happens. I wonder if I am just unusual in using these cards for analogue terrestrial, and most people are using DVB-T or satellite/cable, and so not many people are suffering...?

"Fiev" wrote:

do you have any idea if one of the cards might be faulty. could be that the dodgy files are only coming from one of the tuners. perhaps disable one for a while and see if you only get good files. i know you'll lose dual tuner capability for a while, but it might isolate the glitch.

No better I'm afraid – interestingly, I have found by switching between channels on Live TV I can make the same problem occur – 50 switches of channels resulted in two occurrences of lost audio. I don't think that's new with the latest drivers, just that I hadn't tried that many channel switches before.

Next idea please :-)

Thanks Jason, I'll give this a go and report back...
Cheers

Hi

I have just purchased an
Elonex Artisan LX. The two
tuners are
Hauppauge
Hybrid WinTV Nova-T. I
am using a standard aerial
and a powered
amplifier/splitter. The signal
quality is good – picture is
perfect
and
most
recordings are fine. But
about 1 in every 10
recordings have no
audio.
None
at all from beginning to end.
All other recordings are
fine. I have
copied
a
faulty recording to my
desktop PC and there is no
audio there either
when
played with media player, so
it looks as if the tuner card

Re: Audio missing from some recorded programmes

is not
writing
any
audio into the MPEG
stream. Elonex are stumped
– they have updated
the
drivers to the latest on the
Hauppauge site, and have
replaced both
tuner
cards. They say they have
never seen this before, and a
search of the
forums
both here and on Micro\$oft
suggests no-one else has
either! I am only
trying
to hear standard stereo audio
on the line out phonos, not
anything
more
challenging.

Anyone got any ideas where
I go from here? Is the
MPEG data generated
entirely on the tuner card so
the audio must go missing
that early in
the
recording? Or could MCE
be losing it afterwards? This
fault occurs
even if
only only one of the Tuners
is in use.

Hope someone can help...

Tim
