I have tried every possible setting (and also restarted my computer for each new setting to take effect). I have no problems with font size or clarity, and no problems with icon size or clarity...on both my desktop, or surfing the Web when it come to seeing print, text, or script. The problem is with the pictures, media, and videos...the pictures are blurry regardless pixel setting, the clarity and resolution is always horrible...I still have to hit CTRL + F5 to re-load each page just to see the pictures clearly. The resolution on my desktop does match the resolution Web setting psi at 96 psi. I would like to by-pass hitting this command everytime I want to see something clearly. I haven't changed the original settings, they are at the factory default...

I agree with Tom. You can always use the desktop Appearance/Advanced settings or the default zoom settings in your applications to reduce the sizes of most items.

The resolution is running at full throttle at 1920x1200...I think it's the default (I haven't changed it). If I ran it at 1280x800 everything is HUGE!
Must be something else???

"Tom Scales" wrote:

What resolution are you running at and what is native for your I6000?
Mine
is 1280x800. You MUST run your machine at the native resolution or it
will
be blurry.

Tom

I have a new Inspirion 6000, Windows XP Media Center Edition, and an ATI Mobility Radeon X300 Display, set at the highest (32 bit) in Color quality. Surfing the Web and looking at the images is SO BLURRY. Every time I surf the Web, and I scroll with my mouse over images, I always get a message under my mouse that says..."Shift +R improve the quality of this image. CTRL + F5 reloads the whole page." This big message blocks and obstructs everything that I'm looking at. I have to re-load EVERYTHING (or every page) if I want to see the images/icons/pictures clearly. For example, if I want to look at bikinis on Victoria's Secret, every single item that I want to see (or click on), I have to re-load every image one-by-one or page-by-page if I want to see something clearly. I can barely recognize what the images are. It's so time consuming. Can I just bypass, or fix the settings so I never have to hit CTRL and F5 together again? I've tried right-clicking on the desktop, clicking properties, and changing the Screen resolution pixels in every possible scenario, but nothing. Please help! Thanksabunch! :(
