The space bar advances the cursor forward. You are talking about a non-standard placement of another key (where your "space bar" only occupies the right half of where a normal space bar would be, and the "back" key occupies the left half of where a normal space bar would be).

Two different keys, two different functions. If you want that non-standard keyboard layout, you'll have to buy a keyboard that offers that. Given that it is non-standard, you may find that availability is not too great.

the keyboard spacing bars are reversed :so when I press the left bar it goes forward, and when I press the right bar it goes backward, I need it the other way around. I used to know how but it has been too many years.
