First I assume that you are aware that your new Tuner card will not work with MCE it will only work with its own XP based application. Do you currently have a card in your PCI-X slot and if so what card is it.

I've searched around and coulnt find any answers to my problem so here it goes.

I just bought a new tv tuner card, a mercurt ez view.

If i have the tuner card in any pci bus except the one directly below my pci-x bus it will boot up without video and the motherboard won't complain about no video card, it seems to boot up normally. Just no video.

If i have the card in the bus directly below the pci-x bus my computer will boot up fine but windows will not be able to detect the hardware.

I've herd this is because tv tuner cards will have a problem with sharing the irq with the pci-x bus, but i'm not completly sure on it.

The card does'nt work in either of my computers, one is an amd athelon 2600 with a radeon 9800 pro video card. The machine i want the card in is an amd 64-bit athelon 3200 and a radeon x300 series card.any help would be appreciated.
