Assuming you're on Connect, there are several diagnostic tools you can download that will grab a snapshot of your computer (one's for the basic snapshot, another download gets you the Media Center-specific snapshot). You can attach these snapshots to a bug report filed with the beta client program.

Clean install of windows Vista. CPU Intel P4 2.8G, 1G ram, creative audigy 2 sound card, geforce 5500 video card. Drivers wise, both creative and geforce are using the most up-to-date beta versions.

You haven't mentioned your hardware specifications.
Did you upgrade to Vista?or,it was a clean installation?

General Information:
Vista RC1 and the Media Center will get an error after the first-time setup.
With an error like this:

Unhandled Exception – 10/01/2006 21:09:34
Message: The specified module could not be found.

Re: Vista Media Center not starting

(Exception from
HRESULT:
0x8007007E)
Exception:
System.IO.FileNotFoundException: The specified module
could not be
found.

I can start it up for like 10secs until the error comes up
everytime.

It
seems the error comes up when it's trying to load
something...Hope
someone
can help me with that.
