I don't know much about this, but I'd be interested to know what the TV card is, and whether it is recording digital or analogue – and if it is the latter, is the encoder built into the TV card hardware, or is it a software encoder? If it is software, that might hit the processor quite hard?

Yup, I read the rest of the thread and I'd definitely agree that hyperthreading shouldn't be an issue here (if it was an issue with MCE, it would have been flushed out ages ago).

What video card is the OP using? Perhaps I skimmed through too quickly, but I don't think that the video card make and model was provided... that, in addition to a known good DVD decoder would be chief culprits into Recorded TV playback issues (assuming the file was recorded properly).
