I recently did some maintainance on my PC (registry cleanup, windows updates, etc) and all went well and i had no problems for a few days, everything worked as normal. Then i tried to watch live TV in a window (something i do alot without any problems) but when it transfered from full screen to a window Media centre reported 'Stopped' as if i was watching a recorded program and pressed STOP. I pressed 'OK' 'Live TV' etc nothing would start the TV again and it will either crash my PC or report an error....

EHshell.exe – Common Language Runtime Debugging Service  
Application has generated an exception that could not be handled.  
Process id=0x1084(4228), Thread id=0xafc(2812)

Then i have to terminate Media centre.

I did see an error message once reporting a missing file but i cant generate the same message again so i cant say what the file name is.

I have tried undoing regclean and rolling back drivers but nothing works. I do not have install discs, only a recovery partition (as supplied by Hewlett packard) but this will reset the whole thing to factory defaults and as i have had my PC for 3 years with several upgrades i dont think this is an option.

Also, around the same time as the cleanup I updated Zone Alarm and installed Corel WinDVD9.

PLEASE HELP !!! I hate my PC getting the better of me but i have to admit defeat this time :(

My system is:–

HP Pavilion  
Windows XP Media Center Edition Service Pack 2  
Hauppauge WinTV PVR PCI II  
Creative SB Audigy 2 ZS
