MS has taken a pretty good stab at making interoperability doable between AD and *nix systems. Windows Services for Unix is freely available and good for authenticating *nix clients against AD and sharing resources across both platforms. I haven't had to use it much in a production environment, but it installed like a dream in a test bed.

<http://www.microsoft.com/windows/sfu/default.asp> is its home on the Microsoft website. Download the service, read the white paper and product docs.
