Hi.

Is the DHCP behind or in front the firewall? check if the firewall is not blocking the DHCP packets.

Is the DHCP in the same client's network? If not, you could need a DHCP relay agent or a DHCP compliant router.

You can also use netmon and analyze the packets that clients are receiving. Netmon is free and an excellent troubleshooting packet tool.

> Thanks for your response. I determined that the internet firewall was the real issue. I'm very confused as I'm simply trying to get my 2000 Prof. client to log onto the domain. I made the change in the firewall and corrected the pinging issue. I'm still having problems with the DHCP server not assigning IP addresses. Can you tell me what would cause that. I put static info in the TCPIP and I'm logging onto the domain, but the server will not assign an IP address.
