The "Directory" icon from the network places can be removed with the following GP setting:

User Configuration\Administrative Templates\Desktop\Active Directory, "hide active directory folder"

After a shared folder has been in AD (WIN2K3), from a client I should be able to:

1. Open My Network Places or Network Neighborhood.
2. Double-click Entire Network.
3. Select Entire Contents.
4. Double-click Directory.

When I double-click on the "Entire Contents" I do not see the "Directory".
What am I missing?

Thanks for any help....
