Hi all.

Im attempting to create a child domain for an existing domain we are running. Its a windows 2000 AD enabled in Native mode. We are also running Exchange 2k also in native mode.

Ive created the child domain but im unable to log into it using my enterprise admin account from the root domain. Did i miss a step somewhere? I need to be able to use my account in the child domain as we are planning to deploy a second exchange server in the child domain.

Thanks
