Hello Scott,

Using the Restricted Groups feature in the Group Policies you are able to define the members of a local group of the computers the GPO applies to (such as Administrators). However you can not have individual settings (manually configured) per client and the groups you apply here are on every of the machines, not on a individual "this user on that computer" setting. If you want to do this you'll have to do it manually or per scripting on each machine, or use a different GPO for each client which is not the best idea (but technically possible).
