Hello,

One of our Domain Controllers is prompting warning messages to MOM:

The DC Locator service is not advertising. This means that no clients will be able to connect to this Domain Controller. When queried, the DC Locator returned a remote DC (servername), instead of local DC ().

I ran DCDIAG and all the tests passed except "frsevent".

Is there anyone who could help?

The system is Windows 2003 Standard Server...

–Henkka
