You probably have an account on a machine that has an old password in it. Run LockoutStatus.exe from the link below and select the security template. This will generate logs. Examine the logs and look for your id and it should provide an IP address that is failing authentication. Go to that machine and reset the password.

ALoInfo will provide where dc's are starting lockout as well so you can see which site this is starting in.

You may want to consider using a service type account in the future, so that it doesn't impact you logging on.
