What is the best way to restrict users from running certain applications on Win2k3 Terminal Server?

I mostly just want to segregate between domain users and domain admins and have a list of software that domain users can run and have domain admins run any of the software.

if I were to create GPO for on gpmc what steps do I need to this to implement this on a single terminal server?

can I use software security restriction to do this also?

Thanks,
Tadashi
