I have a domain that I put in a dmz. This domain is 123.abc.com. The internal domain is 456.abc.com. I did not make this a child domain as it is in the dmz and I am worried about security issues. I am looking to make a one way trust so that the DMZ domain trusts the internal domain.

I have DNS running in the DMZ controller but I can't get the domains to talk to each other. Neither of them know how to talk. I think that it is a DNS issue but I am not sure. My access lists for the firewall are allowing all traffic so I don't see that as an issue. Any insight would be appreciated

.
