Without going into all the details as to why....

I need to be able to delegate the ability for an account to be able to modify the following attributes and only the following attributes on a group of user accounts.

sAMAccountName
userPrincipalName
mailNickName

After looking through the delegation on a user object (ADUC) it doesn't seem as though the items you can delegate correspond 1 to 1 with the actual attributes of the object. Example, I go to delegate on an OU and choose the User object, go to the properties tab and scroll through the entire list. I don't see any of these three attributes to delegate.

Does anyone know how I would be able to delegate the ability to change these three attributes on user objects?

Thanks,
Tim
