-

I configured 3 machines on the same domain

A
Windows 2000 Server
SQL Server
IIS
ASP.Net

B
Windows XP
ADAM

C
Windows XP
ADAM

>From machine A I can successfully execute the following query to return data from ADAM instance on B or C, using Query Analyzer (having configured a linked server)

```
SELECT *  
FROM  
OPENQUERY(ADSI,'<LDAP://machineB:389/O=xxx,C=UK>;((OBJECTCLASS=*))';EMPLOYEEID,NAME,TITLE,  
SN,TelephoneNumber;SUBTREE')
```

or

```
SELECT *  
FROM  
OPENQUERY(ADSI,'<LDAP://machineC:389/O=xxx,C=UK>;((OBJECTCLASS=*))';EMPLOYEEID,NAME,TITLE,  
SN,TelephoneNumber;SUBTREE')
```

>From the front end using the web server on machineA I can run all reports, including the reports that use the above query, accessing ADAM on machineB. However if I alter the stored procedures to use machineC I get the following error:

ADAM AND ASP.NET

OLE DB provider 'ADSDSOObject' reported an error. The provider indicates that the user did not have the permission to perform the operation.

Additional Information:

SQL server runs within the context of a domain user with local and domain admin rights

The said domain user has been added as a windows account in ADAM (as a Reader within Roles), so have 'service' and 'system' accounts

Any clues greatly appreciated
