Using Windows 2000 Active Directory. I have a user account that is used as a service account which needs very specific permissions.

I have set these permissions and removed some of the generic permissions that are there by default. However, after approx 1 hour, the permissions revert to the generic permissions assigned when the account is created – removing the permissions I specifically set.

I have turned off permission inheritance and ADC (just in case) but the permissions are still being propagated to the user objects.

Anyone have any ideas??

Setesh
