Make the account a member of one or both of the following groups:

Account Operators (which can log on locally, Shut down the system and has no members, and it can create and manage users and groups in the domain, including its own membership and that of the Server Operators. This group is a service administrator because it can modify Server Operators, which in turn can modify domain controller settings. As a best practice, leave the membership of this group empty and do not use it at all for any delegated administration)

Server Operators (which can Back up files and directories, Change the system time, Force shutdown from a remote system, Allow log on locally, Restore files and directories, Shut down the system)

The rights associated with each group are defined in this white paper:
