OK. This is going to be a matter of writing a script that pulls this info. from each box using WMI.

How to get the list of servers? Either read a text file, or pull all servers from the AD.

Do you need any tips with the script?

The alternative is something like SMS or LANDesk. These systems management systems will have this info. in their inventories. You can then build SQL queries (using the respective GUI – you don't need to know SQL) to get this information.
